## PASTA worksheet

I. Define business and security objectives	Sneaker company  Make 2-3 notes of specific business requirements that will be analyzed.  • Users can create member profiles internally or by connecting external accounts.  • The app must process financial transactions.
II. Define the technical scope	<ul> <li>The app should be in compliance with PCI-DSS.</li> <li>List of technologies used by the application: <ul> <li>Application programming interface (API)</li> <li>Public key infrastructure (PKI)</li> <li>Advanced encryption system (AES)</li> <li>SHA-256</li> <li>SQL</li> </ul> </li> </ul>
	APIs facilitate the exchange of data between customers, partners, and employees, so they should be prioritized. They handle a lot of sensitive data while they connect various users and systems together. However, details such as which APIs are being used should be considered before prioritizing one technology over another. So, they can be more prone to security vulnerabilities because there's a larger attack surface.
III. Decompose application	Sample data flow diagram
IV. Threat analysis	List 2 types of threats in the PASTA worksheet that are risks to the information being handled by the application.  • Injection • Session hijacking
V. Vulnerability analysis	List 2 vulnerabilities in the PASTA worksheet that could be exploited.  • Lack of prepared statements • Broken API token
VI. Attack modeling	Sample attack tree diagram

VII. Risk analysis and	Li
impact	

List **4 security controls** that can reduce risk. SHA-256, incident response procedures, password policy, principle of least privilege
